## Rainfall Data from Parana State, Brazil

Loading and Summarizing the Data

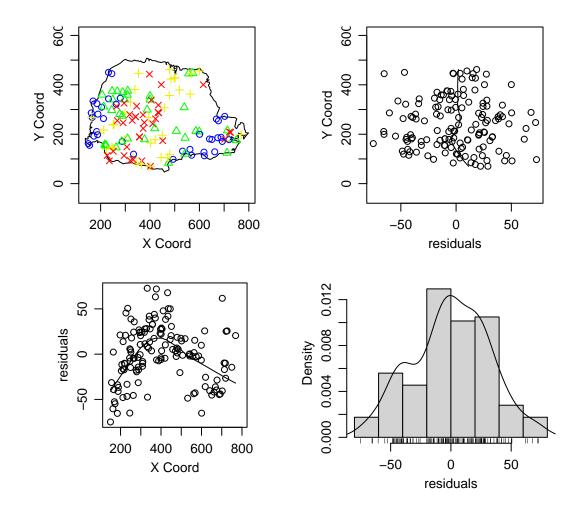

```
# install.packages("geoR")
library(geoR)
data(parana)
summary(parana)
## Number of data points: 143
##
## Coordinates summary
##
           east
## min 150.1220 70.3600
## max 768.5087 461.9681
##
## Distance summary
##
        min
     1.0000 619.4925
##
##
## Borders summary
##
                   north
           east
## min 137.9873 46.7695
## max 798.6256 507.9295
## Data summary
       Min. 1st Qu.
                       Median
                                  Mean 3rd Qu.
## 162.7700 234.1900 269.9200 274.4106 318.2300 413.7000
## Other elements in the geodata object
## [1] "loci.paper"
library(fields)
quilt.plot(parana$coords, parana$data, ny = 36, ylim = c(0, 600),
           xlim = c(125, 800), xlab = "Easting", ylab = "Northing")
lines(parana$borders)
```

plot(parana, lowess = TRUE)

plot(parana, trend = "1st", lowess = TRUE)

### Variogram Analysis

plot(parana.vario)

```
parana.vario <- variog(parana, max.dist = 300, cex = 0.5, option = "cloud")

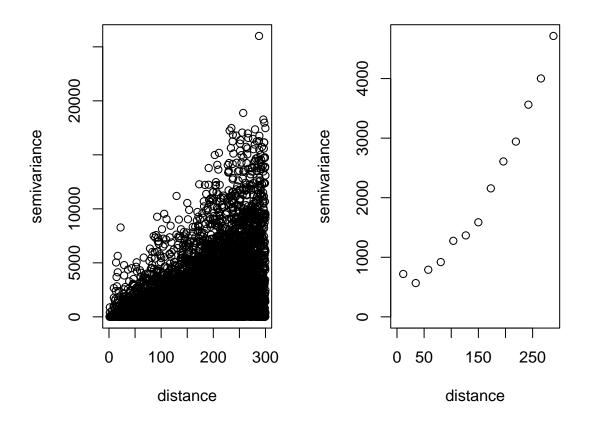

## variog: computing omnidirectional variogram

par(mfrow = c(1, 2))
parana.vario <- variog(parana, max.dist = 300, cex = 0.5, option = "cloud")

## variog: computing omnidirectional variogram

plot(parana.vario)
parana.vario <- variog(parana, max.dist = 300, cex = 0.5)

## variog: computing omnidirectional variogram</pre>
```

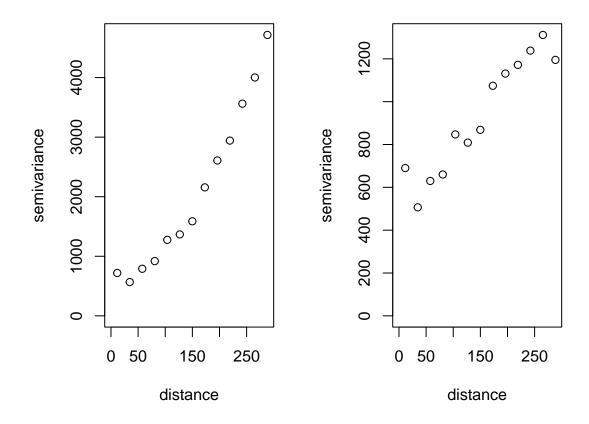

```
par(mfrow = c(1, 2))
parana.vario <- variog(parana, max.dist = 300, cex = 0.5)</pre>
```

## variog: computing omnidirectional variogram

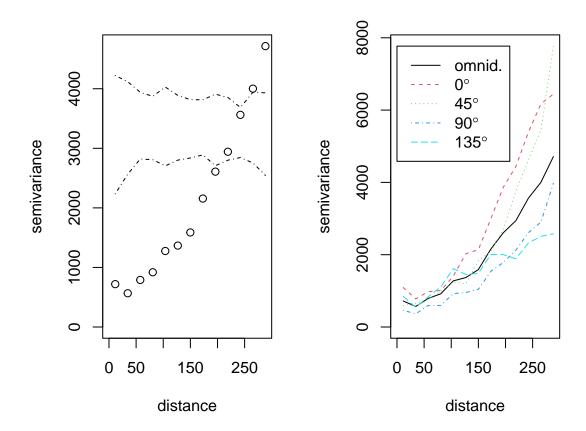

```
plot(parana.vario)
parana.variot <- variog(parana, trend = "1st", max.dist = 300)</pre>
```

## variog: computing omnidirectional variogram

plot(parana.variot)

```
parana.v <- variog(parana, max.dist = 300)</pre>
## variog: computing omnidirectional variogram
parana.v.env <- variog.mc.env(parana, obj.variog = parana.v)</pre>
## variog.env: generating 99 simulations by permutating data values
## variog.env: computing the empirical variogram for the 99 simulations
## variog.env: computing the envelops
plot(parana.v, env = parana.v.env)
parana.v4 <- variog4(parana, max.dist = 300)</pre>
## variog: computing variogram for direction = 0 degrees (0 radians)
           tolerance angle = 22.5 degrees (0.393 radians)
## variog: computing variogram for direction = 45 degrees (0.785 radians)
           tolerance angle = 22.5 degrees (0.393 radians)
## variog: computing variogram for direction = 90 degrees (1.571 radians)
##
           tolerance angle = 22.5 degrees (0.393 radians)
## variog: computing variogram for direction = 135 degrees (2.356 radians)
           tolerance angle = 22.5 degrees (0.393 radians)
## variog: computing omnidirectional variogram
```

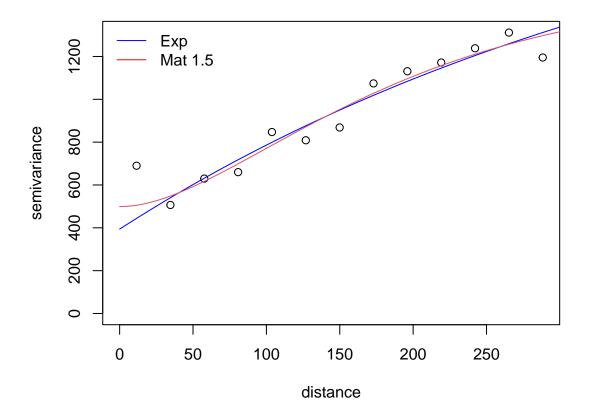

### Parameter Estimation

```
# With Linear Trend
parana.vtfit.exp <- variofit(parana.variot)</pre>
